- Problem
- XML / JSON
- API
- ASP.NET

WHERE DO DATA COME FROM

Any one system can't contain all the needed data

So how does an application get data from *another* application?

WEBPAGES AND HTML

</html>
```

JSON OR XML

Data format better suited for applications

JSON

- E.g.
<https://cvrapi.dk/api?search=novo&country=dk>
- JavaScript Object Notation
- Lightweight
- Simple to parse with
<https://www.newtonsoft.com/json>

XML

- E.g.
<https://cvrapi.dk/api?search=novo&country=dk&format=xml>
- Extensible Markup language
- Verbose
- Parse with <https://learn.microsoft.com/en-us/dotnet/api/system.xml.xmldocument?view=net-6.0>

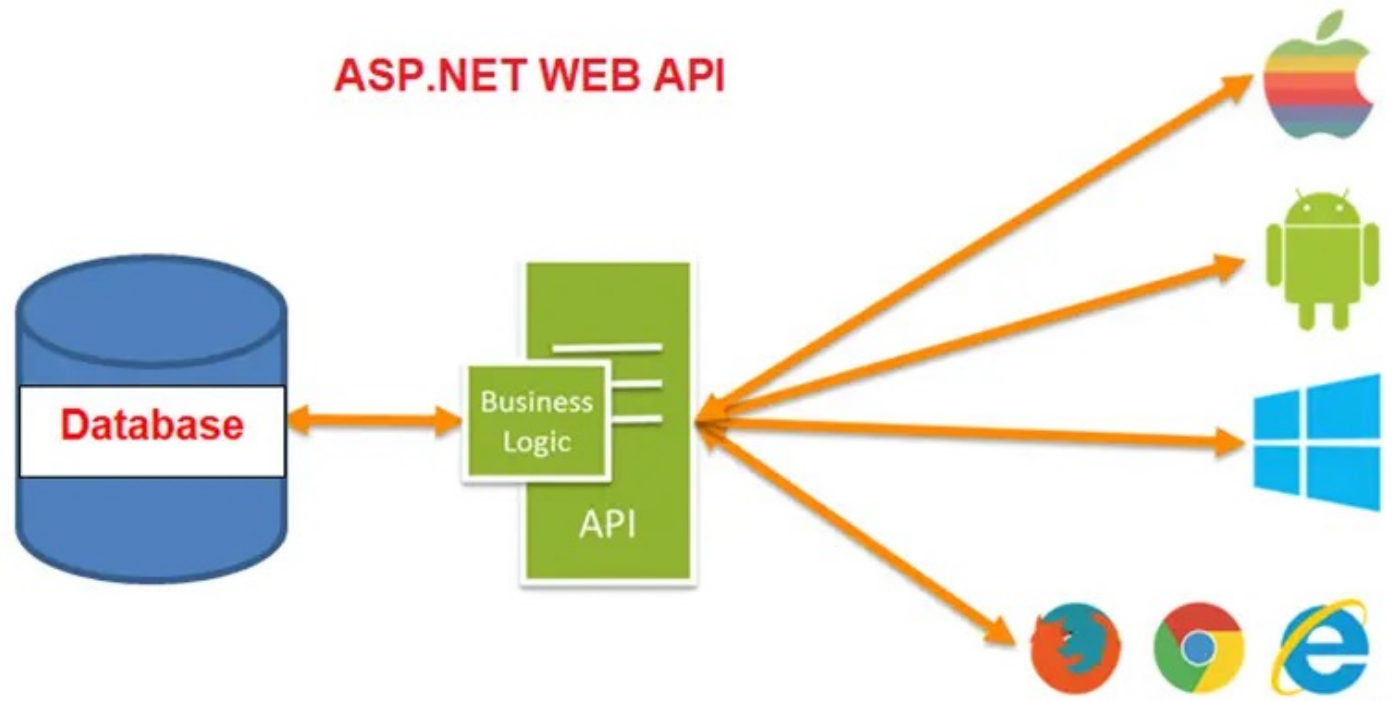

URL

Uniform resource locator

ASP.NET WEB API

- This is Microsoft's recommended way of creating an API
 - Application Programming Interface

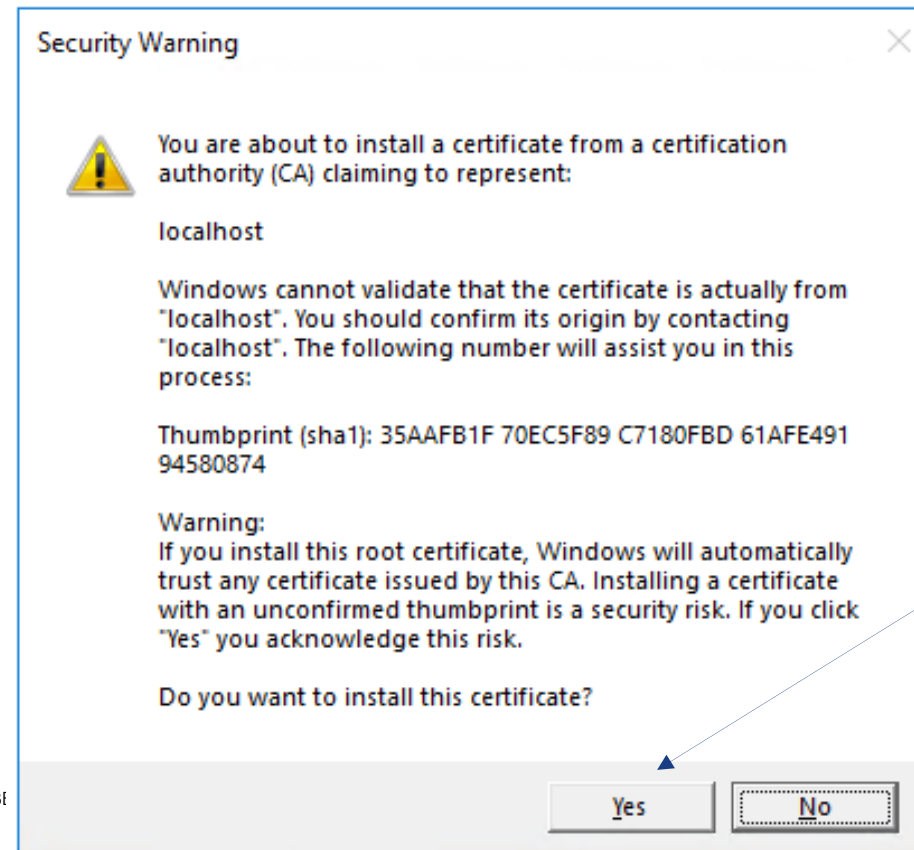

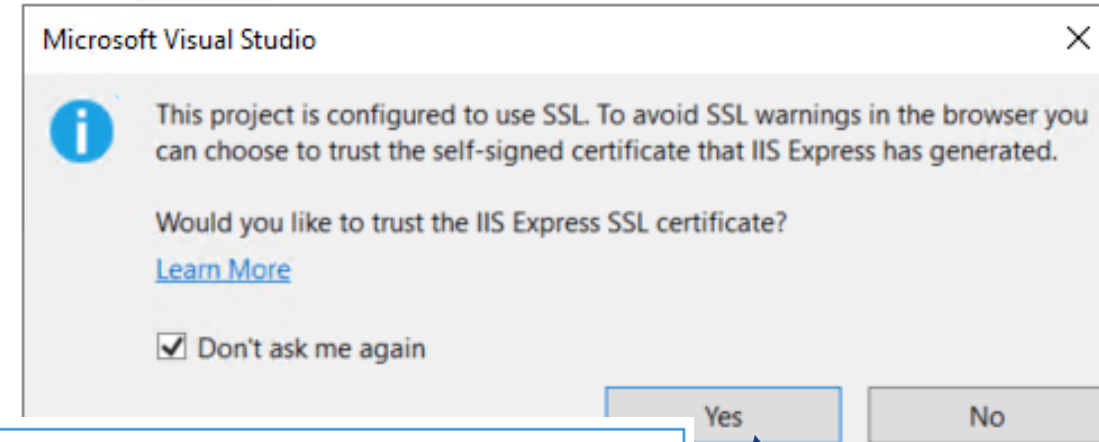

<https://dotnettutorials.net>

CREATING A PROJECT

In Visual Studio

1. In the *File* menu choose *New->Project*
2. Search for Web API and select **'ASP.NET Core Web API'**
3. In the Additional information menu
 1. Make sure you use .NET 6.0 or higher
 2. Make sure you *Use Controllers* are selected
4. Run the project.

REQUESTS

- HTTP Verbs
- **GET**
- POST
- PUT
- PATCH
- DELETE

```
[HttpGet("{id}")]  
public async Task<ActionResult<TodoItem>> GetTodoItem(long  
id) {  
    // GET todoItem  
    // TodoItem todoItem = ...  
    if (todoItem == null) {  
        return NotFound();  
    }  
    return todoItem;  
}
```

Used to return resources from a web server API (one or many)

TASK + ASYNC/AWAIT

You will see this in much greater details in SW4SWD

- Task is a lightweight thread.
 - “All” methods that contains ‘async’ in name returns a task.
- Task<T> can contain data.
- `await` unwraps (among other things) inner data
 - `string stringData = await httpClient.GetStringAsync(URL);`
- If you use await in a method body, the body needs to be decorated with `async` and return a Task

REQUESTS

- HTTP Verbs
- GET
- **POST**
- PUT
- PATCH
- DELETE

```
[HttpPost]
```

```
public async Task<ActionResult<TodoItem>>
```

```
PostTodoItem(TodoItem todoItem)
```

```
{
```

```
    return CreatedAtAction(nameof(GetTodoItem), new { id =  
todoItem.Id }, todoItem);
```

```
}
```

Used to create new resources on the web server

REQUESTS

- HTTP Verbs
- GET
- POST
- **PUT**
- PATCH
- DELETE

```
[HttpPut("{id}")]  
public async Task<IActionResult> PutTodoItem(long id,  
TodoItem todoItem)  
{  
    if (id != todoItem.Id) {  
        return BadRequest();  
    }  
    return NoContent();  
}
```

Used to update existing resources on the server

REQUESTS

- HTTP Verbs
- GET
- POST
- PUT
- PATCH
- **DELETE**

```
[HttpDelete("{id}")]  
public async Task<IActionResult> DeleteTodoItem(long id)  
{  
    var todoItem = null; // Find resources somewhere  
    if (todoItem == null) {  
        return NotFound();  
    }  
    return NoContent();  
}
```

Used to delete resources from the

REQUESTS

- HTTP Verbs
- GET
- POST
- PUT
- **PATCH**
- DELETE

Used to update resources from partial documents

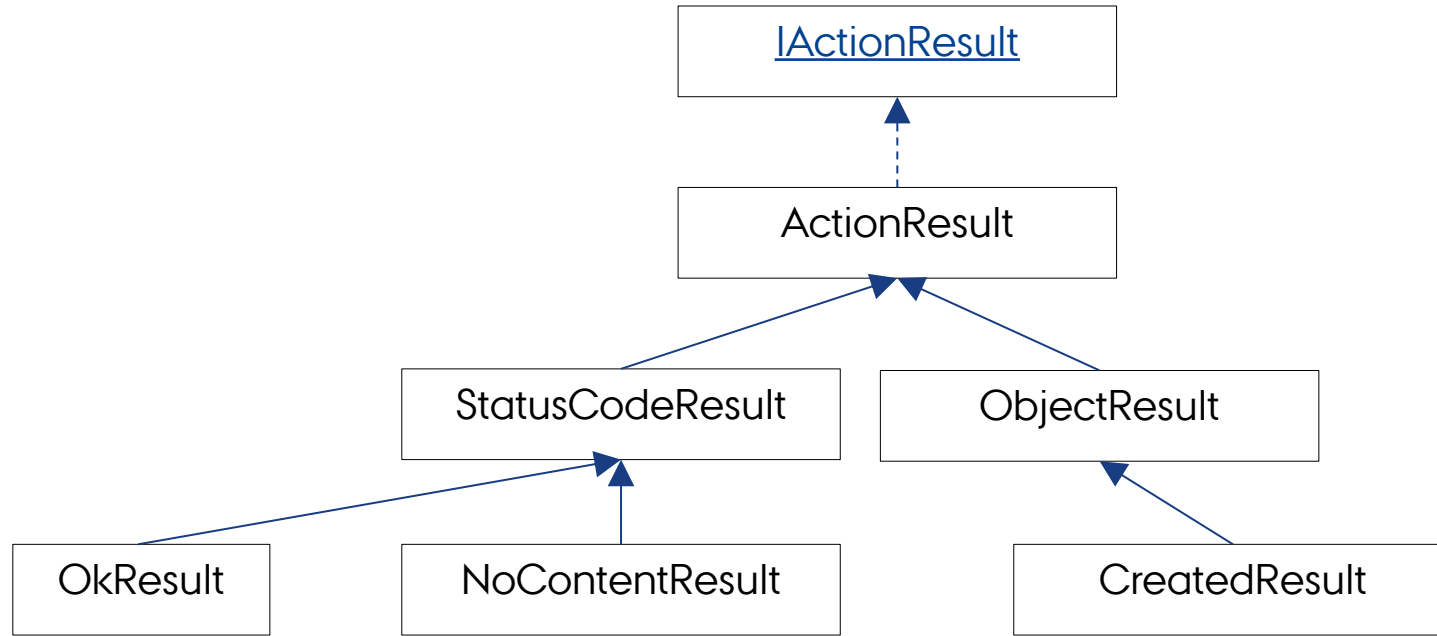

HTTP RESPONSE CODES

1. [Informational responses](#) (100 – 199)
2. [Successful responses](#) (200 – 299)
 1. 200 OK
 2. 201 CREATED
 3. 204 NO CONTENT
3. [Redirection messages](#) (300 – 399)
 1. NOT MODIFIED
4. [Client error responses](#) (400 – 499)
 1. 403 FORBIDDEN
 2. 404 NOT FOUND
5. [Server error responses](#) (500 – 599)
 1. 500 INTERNAL SERVER ERROR
